

Practice-Wise Opportunity Identifier Tool

Production Blueprint — how the working prototype becomes a production-ready product

Prepared by Mohit Sharma · 19 July 2026

What this product is. The tool converts public information about a company into a mapped, practice-wise register of legal exposure and advisory opportunity. A business development member or a lawyer names a company; the tool gathers the public record and the firm's own documents, and one screen answers: what is emerging, which practice areas are relevant, what legal work could arise, on what time horizon, and how to use it for pitch preparation. Business development prepares pitches with it, knowledge management maintains its sources, practice lawyers read their own team's table, and partners approve everything before client use.

Where it stands today. The prototype is a complete working walkthrough — sign-in, projects, guided inputs, an agentic analysis run, a practice-wise report with charts, cited detail reports, sharing, PDF export and activity logs — deployed at mohitlucio.github.io/practice-wise-opportunity-identifier and evaluated on two datasets built from thirty-one real public documents (WhatsApp/Meta and Reliance Industries), with every claim cited to its original source. Time horizons are fixed as: immediate 0–6 months, medium-term 6–12 months, long-term beyond 12 months.

How to read this blueprint. Sections 1 and 2 are the two production architectures, drawn as editable diagrams. Section 3 is the delivery roadmap. Sections 4–6 cover the platform, security and service targets. Section 7 walks every prototype screen and names the production component that industrialises it, and the appendices give the register schema and the screen-to-component map.

1 · Architecture A: how Browse Online works

Browse Online is the screen where a lawyer asks for the public record and receives a grouped, cited, pre-selected document list. In production, eight components stand behind that screen. The lawyer's request travels top to bottom; every stage keeps the source and the date of every document.

Architecture A — the path from the lawyer's request to the pre-selected result list.

The components, one by one

- **Lawyer's request.** Exactly the three inputs on the prototype screen: company, period, coverage. Nothing else is needed, which keeps the screen one click from useful.
- **Search orchestrator.** Resolves the company into a legal-entity cluster (Reliance Industries also means RIL, Jio, JioStar, RCPL) and issues one retrieval task per selected research area.
- **Whitelist registry.** The production version of the prototype's coverage note: a governed list of approved sources with owner, cadence and terms recorded per entry. No fetch happens outside it.
- **Connector layer.** Three adapter families: API connectors where official interfaces exist (SEC EDGAR, Indian Kanoon, SEBI), feed watchers for government publishers (PIB, e-Gazette), and polite managed crawlers for court registries and company investor pages. Each connector normalises to the same document envelope: content, source, date, type.

- **Fetch and normalise.** Robots and rate limits honoured, clean text extracted, source and date stamped, content hashed so a document is stored once no matter how many routes find it.
- **Document store and index.** Immutable originals plus extracted text, indexed for keyword and semantic search, joined to the entity graph so a document knows which companies it is about.
- **Retrieval and ranking.** Company filter, period filter, seven-area classification, the statutes-in-force rule, freshness ranking. This stage produces exactly what the prototype displays, including the in-force tags and the count of matches outside the period.
- **Results to the lawyer.** Grouped by research area, pre-selected, each row with source host, date and the original link, ready for the run.

Source families and their cadence

Family	Examples	Method	Cadence
Courts and tribunals	Supreme Court, High Court registries, NCLAT, Indian Kanoon	API and crawler	Daily
Regulators	CCI orders, SEBI filings, SEC EDGAR, MeitY	API and feeds	Daily
Government publishers	Press Information Bureau, e-Gazette	Feed watchers	Hourly
Company disclosures	Investor relations pages, exchange filings, DRHPs	Crawler and feeds	Daily
Firm repository	Internal briefs and know-how	DMS connector	On change

Operations. A scheduler runs each source at its cadence, a freshness monitor flags analysed projects whose inputs have newer versions, and that signal powers the monthly register refresh recommended by the methodology. Connector health, fetch failures and whitelist changes all land in the audit log.

2 · Architecture B: how documents become the register

The run screen shows the AI Analysis Agent working through its stages. This is the production pipeline behind those exact lines: eight stages from raw documents to the approved, published register. The destination of every run is one structure — the register row — and everything the user sees renders from it.

Architecture B — eight stages from raw documents to the approved, published register.

The stages in production terms

No.	Stage	What actually happens
1	Parse every input	PDF, HTML and Word to clean text with page and paragraph anchors kept. OCR for scans, layout models for tables and court orders. Output: addressable passages.
2	Extract dated legal signals	A grounded LLM pass over each document plus deterministic extractors for dates, amounts, case numbers and parties. Every signal keeps its passage anchor. Example from the prototype data: the CCI order of 18 Nov 2024 with the Rs 213.14 crore penalty.
3	Build exposure items	Signals that tell one story cluster into a single exposure with a timeline. The CCI order, the NCLAT judgment and the Supreme Court status form one matter, exactly as one row in the prototype.
4	Classify and map	Four classifiers per exposure: practice areas against the firm taxonomy (one lead, any supporting), service lines selected from the firm playbook catalogue, engagement type (contentious, advisory, transactional, compliance), and timing derived from trigger dates (immediate within 6 months, medium term 6 to 12 months, long term more than 12 months).
5	Bind citations	Every sentence must link to a stored passage. Uncited content is rejected here, before anyone sees it. This is the rule the prototype states as: every claim carries a clickable citation.
6	Write the register row	The exposure is stored in the fixed schema of Appendix A. Tables, charts, detail reports and the PDF all render from this one row.
7	Partner review gate	A reviewing lawyer approves, edits or dismisses each row. Rows marked Emerging get the hardest review. State changes are logged with the reviewer.
8	Publish to the project	The approved register becomes the report the user sees, and the shared and PDF versions of it.

Model strategy and guardrails

- **Grounded only.** Generation always runs over retrieved passages from the project's own inputs. The model is never asked open questions from memory.
- **Rules where rules win.** Dates, amounts, citations and deadlines come from deterministic extractors; the LLM interprets and drafts around verified anchors.
- **Evidence tiers are semantic, not decorative.** High means an order, filing or gazette is in the inputs. Medium means an official announcement. Emerging means an inference, and it is routed to the hardest human review.
- **Two-model check on the mapping.** Practice-area and service-line mapping is proposed by one model and verified by a second pass against the taxonomy definitions; disagreements queue for human mapping.
- **Evaluation set.** The two prototype datasets, twenty-two exposures with fully known correct answers, become the first regression suite for extraction quality.

3 · Production roadmap

Three releases take the prototype to firm-wide production. Each phase has a fixed scope and one measurable exit test; nothing enters a later phase until the earlier exit test passes. Timelines are indicative and assume the phase-1 team below.

Phase	Timeline	What ships	Exit test
0 · Prototype	Done	Complete UX walkthrough, two evaluated datasets, every behaviour in the product tour (Section 7).	Stakeholder walkthrough approved.
1 · Pilot	Months 1–3	Live Browse Online on 10 whitelisted sources; real pipeline for one practice taxonomy; SSO; server-side projects and sharing; partner review states.	Three real companies analysed; over 80% of register rows approved by partners without edits.
2 · Firm rollout	Months 4–6	Full whitelist; DMS connector; freshness monitor and notifications; PDF service; audit reporting.	Fifty active users; monthly register refresh running on all live projects.
3 · Scale	Months 7–9	CRM export; key-date reminders; cross-project client intelligence views; extraction-quality automation.	Pitch teams cite the tool in a majority of new-business meetings.

Team for phase 1

One product manager, one designer, two full-stack engineers, one data engineer for connectors, one applied AI engineer for the pipeline, and a knowledge lawyer who owns the taxonomy, the playbook catalogue and review quality.

Top risks and the mitigation built into the design

Risk	Mitigation
Source sites change or block crawling	Whitelist governance, per-source health monitoring, adapter isolation so one source failing never breaks the product.
Extraction errors reach a pitch	Citation-mandatory pipeline, evidence tiers, partner review gate, regression suite built from the evaluated datasets.
Lawyers do not adopt it	The report is practice-wise by construction, each team lands on its own table, and the pitch block gives a concrete next action with a date.
Privilege or confidentiality breach	Firm-boundary processing, DMS-deferred permissions, no training on user documents, full audit trail.

Success measures

- **Speed.** Time from company name to reviewed report: under one day in phase 1, under one hour at rollout.
- **Quality.** Share of register rows approved without edits, tracked per pipeline version.
- **Adoption.** Number of pitches prepared with the tool, and their conversion against the baseline.
- **Freshness.** Monthly refresh completion rate across live projects.

4 · Platform, data model and integrations

Core entities

Entity	Purpose
User, Team	Directory-synced identity; team drives default views and permissions.
Project	A company under analysis: owner, members, status, settings.
Source	A whitelist entry: host, family, method, cadence, terms, owner.
Document	An immutable fetched or uploaded file with text, anchors, hash, source, date.
Run	One analysis execution: exact input set, pipeline versions, timings, outcome.
ExposureItem	One register row in the Appendix A schema, with review state and history.
Citation	A link from a sentence to a document passage.
Share	A grant of a project to a user with a permission.
ActivityEvent	The audit record behind the Activity Logs screen.

Service shape

A modular monolith is enough at firm scale: a web application, a worker pool for connectors and pipeline stages, a relational database for entities, object storage for documents, and a search cluster for the index. The two heavy asynchronous jobs, gathering and analysis, run as queued tasks that report stage-level progress, which is what the two agent screens display.

Integrations

- Firm single sign-on and directory for identity and teams.
- Document management system connector for the firm repository step.
- Email for invites and the PDF report; calendar hooks for key-date reminders.
- Optional CRM export so pitch outcomes can be tracked against reports.

5 · Security, privacy and responsible AI

- **Access.** Project-level permissions exactly as the prototype's sharing model: owner, edit, view. The shared banner always names who shared and the permission held.
- **Confidentiality and privilege.** Uploaded documents may be privileged. They stay inside the firm boundary, are never used to train models, and repository access always defers to the DMS permissions.
- **Data protection.** The product processes little personal data by design; what exists (users, activity) is handled under a DPDP-aligned notice, with retention windows per record type.
- **Audit.** The prototype's Activity Logs become an append-only audit trail: every search, run, review decision, share and export, with actor and timestamp.
- **Marks and terms.** The in-product Terms and Conditions govern use, including the Trilegal name and marks, exactly as drafted in the prototype's profile menu.

- **Responsible AI.** Citations mandatory, evidence tiers honest, partner review before client use, conflicts screening before any approach, and the register refreshed monthly so stale horizons are retired rather than trusted.

6 • Non-functional requirements

Dimension	Target
Search response	Browse Online returns its grouped list in under 5 seconds for a warm company, under 30 seconds when a fresh crawl is needed.
Analysis run	A 15 to 30 document project completes in under 3 minutes, with stage-level progress exactly as the agent screen shows.
Freshness	Gazettes, courts and feeds within 24 hours of publication; hourly for feed watchers.
Availability	99.5 percent for the application; connectors degrade per-source without taking the product down.
Cost control	Per-run token budget with caching of parsed documents and reused extractions across refreshes.
Observability	Connector health, pipeline stage timings, extraction quality against the regression suite, and user-facing error states on the exact failed stage.

7 · Product tour: every screen, and what it becomes in production

This section walks the product in the order a new user meets it. Each screen shows the prototype as it exists today, followed by what changes when it is built for production.

7.1 · Sign in and how it works

Prototype screen: Sign in and how it works

The first screen pairs the sign-in form with an animated four-step walkthrough: create a project, gather the inputs, run the analysis, get insights. A new user understands the whole product before entering it. A demo account entry point keeps evaluation friction at zero.

In production. Firm single sign-on replaces the local form, with the same two-panel layout retained. Accounts, teams and roles come from the firm directory, so the Team dropdown in the prototype becomes an assigned attribute rather than a free choice.

7.2 • Projects home

Prototype screen: Projects home

The left panel is the working memory of the product: My projects, projects shared with me, live search, and the profile with settings, theme, terms and sign out. The centre stays calm until a project is opened. Each project card carries its status: Ready to run or Analysed, and a context menu with Rename, Share and Delete.

In production. Projects become server-side records with real ownership, permissions and history. The Shared with me section is driven by actual grants, and the status chip reflects pipeline state in real time.

7.3 • Creating a project

Prototype screen: Creating a project

A project needs only a name. In the prototype the analysis pairs the new project with one of the two evaluated datasets behind the scenes, which the dialog states honestly.

In production. The name is resolved against a company registry (legal entities, group companies, aliases), and the project starts a live gather instead of using a seeded dataset. Everything else in the flow stays identical, which is the point of the prototype.

7.4 • Collecting inputs: the three-step hub

Prototype screen: Collecting inputs: the three-step hub

The input flow is a guided timeline with three numbered steps: collect the inputs, review what goes in, run the Tool. Only the active step is bright, finished steps turn to a tick, and the Run button stays disabled with a plain reason until at least one input exists. The two collection routes sit side by side: Browse Online and Upload from device or firm repository, each with a one-line description and a live count of what it has contributed.

In production. The hub is unchanged in production; it is already the correct interaction. The counts, statuses and the Run gate are driven by the server-side project state.

7.5 • Browse Online: setting up the search

The image shows a prototype of a web application interface for setting up a search. On the left is a sidebar with three sections: 'PROJECTS' containing a '+ New project' button and a 'Search projects' input; 'MY PROJECTS' containing a card for 'Reliance Industries' (dated 18 Jul 2026, status 'Ready to run'); and 'SHARED WITH ME' containing a card for 'WhatsApp (Meta)' (shared by Mohit@trilegal.com, status 'Analysed'). At the bottom of the sidebar is a 'Demo User' profile (Business Development). The main content area is titled 'Browse Online' and includes a sub-header '← Inputs'. It contains two numbered steps: Step 1, 'Set up the search', which has a text input pre-filled with 'Reliance Industries', a 'Search' button, and a 'Period' selector with options 'Last 6 months', 'Last 12 months' (selected), and 'Custom'; a 'Coverage' dropdown; and a note that results update live. Step 2, 'AI Research Agent', explains that it searches documents for 'Reliance Industries' from different online websites and provides a placeholder for where documents will land.

Prototype screen: Browse Online: setting up the search

Browse Online is one page with two numbered steps. Step one is the search set-up: the company name arrives pre-filled, the period is three choices (last 6 months, last 12 months, custom dates), and a Coverage panel lists the seven research areas with the note that the search runs across websites whitelisted by Trilegal for research purposes. Everything is pre-set so the fastest path is a single click on Search.

In production. The controls map one-to-one onto the production search API: company resolves to an entity, the period becomes a date filter, the coverage chips select the seven research-area classifiers. Section 1 is the full architecture behind this screen.

Prototype screen: Browse Online: the AI Research Agent returns documents

Step two is titled by its own state: AI Research Agent, then searching documents for the company from different online websites, then documents found. Results arrive grouped under the seven research areas, every row shows its source host and date, a working source link, and an Added toggle. Everything found is pre-selected, so the user's job is deselection, not hunting. Old-but-in-force statutes are included and tagged, and the tool states how many documents matched outside the chosen period with a one-click widen.

14

In production. The list is produced by the retrieval stage of Architecture A. Pre-selection, the in-force rule and the outside-period count are product behaviour and stay exactly as prototyped.

☒	AI, new energy and retail trends brief Analyst brief · Jul 2026	Read
☒	Jio IPO and growth vectors brief Analyst brief · Jul 2026	Read

[Clear all](#)
- 3 Head back and run**
5 inputs in the run so far.
[Done · review and run](#)

Prototype screen: Upload from device and the firm repository

The second collection route has three numbered steps: files from the device, a firm repository picker that opens as a select list with a Read link per brief, and a return step showing the running input count. Uploads join the run instantly.

In production. Device uploads go through virus scanning and document parsing on arrival. The firm repository becomes a real connector to the firm's document management system, honouring its access controls, so a user only sees briefs they are entitled to see.

3 **Run the Tool**
Your inputs become cited exposures mapped to practice areas, time horizons, buyers and pitch hooks, with live charts, a trigger calendar and a shareable PDF report. [How it works](#)

[Run Tool](#) Takes a few seconds - you can adjust inputs any time after.

Prototype screen: Review what goes in

Back on the hub, step two lists every collected input with its origin badge (Web, Device, Repository), a clickable name that opens the document, a direct source link for public documents, and a remove control. Step three explains exactly what the run produces before the user commits.

In production. The review list is the audit anchor: the exact set of inputs behind every run is stored with the run, which is what makes each report reproducible and defensible.

7.9 • The AI Analysis Agent run

Prototype screen: The AI Analysis Agent run

Running the Tool shows the agent's workflow as visible, tickable actions: fetching public documents, reading workspace documents, extracting dated legal signals, identifying exposure areas, mapping to practice areas and service lines, assigning timing, classifying the type of engagement, attaching a citation to every claim. The user watches the analysis assemble rather than staring at a spinner.

In production. Each stage line corresponds to a real pipeline stage in Architecture B, so the progress display is honest telemetry, not theatre. Failures surface on the exact stage that failed with a retry.

7.10 • The report: answers first

Prototype screen: The report: answers first

The report opens with structure, not prose: a stat strip (exposures, practice areas, immediate items, next key date) where every cell is a View details popover, then four charts that answer the assignment questions by name: what risks or opportunities are emerging (engagement donut), which practice areas are relevant (team bars), what legal work could arise (work products per lead practice), and what is the likely time horizon (a practice-by-timing heatmap). Every chart element clicks through to the matters behind it, and the practice bars open that team's table directly.

In production. Charts render from the register only, so figures can never disagree with the tables. The same components render the PDF.

7.11 • The report: one table per practice area

DPDP Act and Rules phase-in: Significant Data Fiduciary programme Lead practice: Data Protection	Compliance	Immediate	Detail >
Traceability writ, Rule 4(2) IT Rules: encryption at stake	Contentious	Medium-term	Detail >

Consumer & Product Regulatory 2 exposures Supporting role - 1 immediate

RISK / OPPORTUNITY	TYPE OF ENGAGEMENT	TIMING	DETAIL
First advertising inside WhatsApp meets the consent architecture Lead practice: Data Protection	Advisory	Immediate	Detail >

Prototype screen: The report: one table per practice area

Below the charts, a divider opens the mapping itself: one card per practice area, ordered by volume, each with its own header (name, exposure count, lead or supporting role, immediate count) and its own table: risk or opportunity, type of engagement as a tinted pill, timing chip, and a Detail button. Where a team plays a supporting role, the row names the lead practice. Global filters for practice area, engagement type, timing and free text sit above, and every practice-area path in the charts and popovers lands here.

In production. This is the practice-wise deliverable of the product. In production the same cards are the landing view a practice lawyer gets from an email link, filtered to their team.

7.12 • The exposure detail report

The image shows a prototype of a web application for managing legal exposure details. The interface is divided into a sidebar on the left and a main content area on the right.

Sidebar (Left):

- PROJECTS:** Includes a '+ New project' button and a search bar.
- MY PROJECTS:** Lists 'Reliance Industries' (18 Jul 2026 - Ready to run) and 'WhatsApp (Meta)' (Shared by Mohit@trilegal.com - Analysed).
- SHARED WITH ME:** Shows 'WhatsApp (Meta)' shared by Mohit@trilegal.com.
- User Info:** 'Demo User', Business Development.

Main Content Area (Right):

- EXPOSURE AND OPPORTUNITY REPORT:** Title 'WhatsApp (Meta)', generated 18 Jul, 16 source documents. Includes a 'Methodology' link.
- Summary:** 10 Exposures, 11 Practice areas. Links to 'View details'.
- What risks or opportunities are emerging:** A donut chart showing 10 exposure items categorized by engagement type: Contentious (2 of 10, 20%), Advisory (5 of 10, 50%), Transactional (1 of 10, 10%), and Compliance (2 of 10, 20%).
- What legal work could arise:** A table of work products identified by lead practice.
- Exposures mapped to practice areas:** A table showing the distribution of exposures across various legal practice areas.
- RISK / OPPORTUNITY:** A list of specific legal issues and their associated lead practices.

EXPOSURE DETAIL (Right Panel):

- Title:** Supreme Court competition endgame: CCI penalty and behavioural regime.
- Tags:** Competition Law, Immediate, Contentious, Evidence: High.
- WHAT HAPPENED:** CCI order 18 Nov 2024 (Rs 213.14 cr); NCLAT judgment 4 Nov 2025 upheld penalty, set aside the 5-year ad-data ban; Meta and WhatsApp complied with consent directions by 16 Mar 2026; SC appeals plus a CCI cross-appeal remain live. (1, 2, 3)
- PRACTICE TEAM:** Competition Law leads, supported by Dispute Resolution, Data Protection.
- SERVICE LINES AND WORK PRODUCTS:** 4 identified.
- KEY DATES FOR THIS EXPOSURE:** H2 2026 - Supreme Court hearings: Meta appeals and the CCI cross-appeal.
- SUGGESTED PITCH:** The angle, The CCI cross-appeal could restore the 5-year advertising-data ban. A quantified ad-revenue-at-risk brief is the door-opener. (1, 2)
- PITCH TO:** General Counsel; Head of Competition, APAC.
- LEAD WITH:** Rs 213.14 cr penalty plus a standing behavioural regime.
- BEST WINDOW:** Ahead of H2 2026 - Supreme Court hearings: Meta appeals and the CCI cross-appeal.
- Meeting material to prepare:** Ad-revenue-at-risk model - Quantify the exposure if the CCI cross-appeal restores the five-year ad-data ban. No one else walks into the GC's office with a number.
- CITATIONS:** 1 CCI order report, SCC Online - open source; 2 NCLAT outcome, Business Standard - open source; 3 SC compliance undertaking, LiveLaw - open source.
- SOURCE DOCUMENTS IN THIS PROJECT:** CCI order, WhatsApp privacy policy; NCLAT judgment summary, Meta v CCI; Supreme Court appeal status brief.

Prototype screen: The exposure detail report

Clicking any row or Detail button opens the full report for that exposure: what happened with dated facts and numbered clickable citations, the practice team, the numbered service lines and work products, key dates for this exposure, and a structured pitch: the angle with its citations, who to pitch, what to lead with, the best window, and the meeting material to prepare. Citations open a popover with the source link; sources without a public link open the workspace document instead, so every citation resolves.

In production. The drawer is rendered from one register row plus its citation anchors. Passage-level highlighting of the cited source is the production upgrade lawyers value most.

7.13 · Sharing a project

Prototype screen: Sharing a project

Share works from the report header and from every project card. Recipients are added as chips with a permission per invite (view or edit), and Send offers two explicit routes: open in the email client or send an internal invite.

In production. Sharing becomes real access grants with notification, and shared recipients see the same banner the prototype shows on the WhatsApp project: who shared it and with what permission.

PRACTICE-WISE OPPORTUNITY IDENTIFIER TOOL · PROJECT REPORT

WhatsApp (Meta): Exposure and Opportunity Report

Prepared by Demo User (Business Development)Generated 19 July 202616 source documents · 10 exposures · 18 citations

1. Summary

Exposures identified	10
Practice areas involved	11
Need action within 6 months	6
Next key date	1 Aug 2026
Type of engagement	Contentious 2 · Advisory 5 · Transactional 1 · Compliance 2

2. Exposures mapped to practice areas

TMT & Digital Regulation · 7 exposures

Risk / opportunity	Type of engagement	Timing
DPDP Act and Rules phase-in: Significant Data Fiduciary programme Lead practice: Data Protection	Compliance	Immediate
Traceability writ, Rule 4(2) IT Rules: encryption at stake	Contentious	Medium-term
WhatsApp Pay at full scale and the 30 percent UPI cap decision Lead practice: Fintech & Payments	Advisory	Immediate
Business platform repricing wave: AI tokens and service-message fees Lead practice: Corporate & Commercial	Transactional	Immediate
AI agents at population scale	Advisory	Medium-term
Intermediary safe-harbour operations and amendment risk	Compliance	Immediate
Tax posture of switched-on India monetisation Lead practice: Tax	Advisory	Medium-term

Competition Law · 4 exposures

Risk / opportunity	Type of engagement	Timing
Supreme Court competition endgame: CCI penalty and behavioural regime	Contentious	Immediate
WhatsApp Pay at full scale and the 30 percent UPI cap decision Lead practice: Fintech & Payments	Advisory	Immediate
First advertising inside WhatsApp meets the consent architecture Lead practice: Data Protection	Advisory	Immediate
FTC v Meta: US divestiture tail-risk and the India read-across	Advisory	Long-term

Data Protection · 4 exposures

Risk / opportunity	Type of engagement	Timing
Supreme Court competition endgame: CCI penalty and behavioural regime Lead practice: Competition Law	Contentious	Immediate
DPDP Act and Rules phase-in: Significant Data Fiduciary programme	Compliance	Immediate
First advertising inside WhatsApp meets the consent architecture	Advisory	Immediate
AI agents at population scale Lead practice: TMT & Digital Regulation	Advisory	Medium-term

Dispute Resolution · 3 exposures

Risk / opportunity	Type of engagement	Timing
Supreme Court competition endgame: CCI penalty and behavioural regime Lead practice: Competition Law	Contentious	Immediate
Traceability writ, Rule 4(2) IT Rules: encryption at stake Lead practice: TMT & Digital Regulation	Contentious	Medium-term
Intermediary safe-harbour operations and amendment risk Lead practice: TMT & Digital Regulation	Compliance	Immediate

Prototype screen: The PDF report

Create PDF report renders the whole analysis as a document: summary, the practice-wise mapping tables, the exposure detail reports with citation markers, key dates, pitch preparation and the numbered citation list. It mirrors the on-screen report exactly.

In production. Server-side rendering produces the same PDF for email and archiving, stamped with the run date and the input list for provenance.

Prototype screen: Settings and the audit trail

Settings is a single page in row format: profile with auto-save, research preferences (the default research period feeds new projects directly), notification choices, and Activity Logs: a timestamped record of sign-ins, searches, runs, uploads, shares and edits.

In production. Preferences move server-side per user. Activity Logs become the compliance-grade audit trail described in Section 5.

Appendix A · The register: field dictionary

Every value below is real and comes from the prototype's Supreme Court competition exposure for WhatsApp (Meta).

Field	Meaning	Example
exposure_title	The matter in one line	Supreme Court competition endgame: CCI penalty and behavioural regime
trigger_events	Dated facts, each cited	CCI order 18 Nov 2024; NCLAT judgment 4 Nov 2025; compliance 16 Mar 2026
evidence_strength	High, Medium or Emerging	High
timing	Immediate, medium term or long term	Immediate
engagement_type	Contentious, advisory, transactional or compliance	Contentious
lead_practice	The team that owns it	Competition Law
supporting_practices	Teams that feed it	Dispute Resolution; Data Protection
service_lines	The work products	SC merits advocacy; cross-appeal defence; compliance audit; penalty refund mechanics
amount_at_stake	The cited number	Rs 213.14 crore penalty plus a standing behavioural regime
decision_maker	Who buys the work	General Counsel; Head of Competition, APAC
suggested_pitch	The angle	A quantified ad-revenue-at-risk brief is the door opener
citations	Title, link, passage anchor	CCI order report; NCLAT outcome; SC compliance undertaking
source_documents	Project inputs behind the row	CCI order PDF; NCLAT case summary; SC status brief

Appendix B · Prototype screen to production component map

Prototype element	Production component
Browse Online set-up card	Search API over the orchestrator and whitelist registry (Architecture A, steps 1 to 3)
AI Research Agent result list	Retrieval and ranking output (Architecture A, steps 4 to 8)
Firm repository picker	Document management system connector with deferred permissions
Review what goes in list	Run input manifest, stored with every run
AI Analysis Agent stages	Pipeline stages 1 to 5 of Architecture B, reported as live telemetry
Stat strip and four question charts	Renderers over the approved register
Practice-area tables	The practice-wise register view, the product's core deliverable
Exposure detail report	One register row with citation anchors and the pitch block
Share dialog	Access grants with notification
Create PDF report	Server-side renderer over the same register
Activity Logs	Append-only audit trail

Prototype element	Production component
Terms and Conditions	Governing terms including the Trilegal marks
